

Assessment guide for practical work

This document describes how the practical work of the course is assessed. It applies to the four compulsory practices, P1 to P4, and to the optional mini-projects. It is published at the beginning of the term and remains stable throughout.

1. Overview

Each compulsory practice is worth 10 points and assessed against a binary rubric of 10 criteria. Each criterion is either met or not met, and each criterion met adds 1 point. A criterion that cannot be decided either way is marked for review by the teacher. The mark of the practical work block is the average of the four practices, with the optional mini-projects adding a small bonus.

2. Submission rules

- One ZIP file per practice, submitted through the virtual campus.
- File name: PN_surname1_surname2_name.zip, with N the number of the practice, in lower case and without accents.
- The ZIP contains exactly three files and no folders: solution.py, execution.txt and report.docx.
- A ZIP with another name, with folders inside or with a different number of files is returned without assessment.
- The optional levels add no files. They are declared in section 6 of the report.
- Late submissions are governed by the general regulation of the course.

3. Common rubric

The ten criteria below apply to every practice. The handout of each practice states how they apply to that particular work.

#	Criterion	Met when
R1	The program runs	solution.py runs end to end and produces output
R2	Baseline established and measured	the report states the numbers of the first version, before any improvement
R3	Improvement justified with numbers	the report names the change made and how the measurements moved
R4	The data used to build and the data used to measure are kept apart	what the work is fitted or filtered on is not what the result is measured on
R5	Metric appropriate to the problem, justified	the report explains why the chosen metric fits this problem
R6	Numerical results present and coherent	the values in the report match execution.txt
R7	Execution trace included	execution.txt is present and shows the run that produced the reported values
R8	Reproducibility	another person running the code with the same files obtains the same numbers
R9	Basic code quality	descriptive variable names, no dead code, reasonable structure
R10	Report complete and coherent with the code	every required section is filled in and agrees with the code

4. Optional mini-projects

Up to three optional mini-projects are offered during the term. Each one is worth 0.3 points on the scale of 10 of the practical work block, plus 0.1 points for the overall quality of the set if all three are submitted. They extend the topics of the compulsory practices and are described in separate handouts.

5. Feedback and review

After each practice is assessed, every student receives a short note on the virtual campus with the marks obtained for each criterion and a brief comment. A face-to-face review can be requested following the official procedure of the school.

6. Honesty and original work

Submitted work must be the student's own. Any line of code or paragraph of the report must be explained and defended in class if requested. Plagiarism between students results in a fail of the practice for everyone involved, following the general regulation.
